

AIR CONDITIONER

5

ABSTRACT OF THE DISCLOSURE

By the use of the suction pressure of a compressor,
the pressure in back pressure chambers 71g and 71h are
10 reduced to open a refrigerant inlet side and a
refrigerant outlet side of an evaporator, and when the
compressor is at rest, by the use of a first coil spring
76 and a second coil spring 77, the refrigerant inlet
side and the refrigerant outlet side of the evaporator 40
15 are closed mechanically. Due to this, it is possible to
minimize a refrigerant leak by the use of an inexpensive
means.
